

Municipal Governance & Buildability - App Summary

What it is

- A Next.js web app for Michigan property-development due diligence across municipalities.
- It combines a quick "Snapshot" score view with "Details" tables, sources, and methodology for residential and commercial paths.

Who it's for

- Primary persona: property buyers, developers, and operators comparing Michigan jurisdictions before buying or building.

What it does

- Searches and lists municipalities, then links to per-jurisdiction profiles.
- Shows Snapshot cards for regulatory intensity, predictability, fiscal burden, transparency, and data confidence.
- Provides path toggle (residential vs commercial) to filter relevant metrics.
- Shows detailed metric tables with units, verification dates, and confidence context.
- Displays source citations per metric and a methodology panel for scoring transparency.
- Includes an illustrative permit-fee calculator with clear disclaimer language.
- Supports structured data import and metric coverage reporting via scripts.

How it works (repo-evidenced architecture)

- UI layer: Next.js App Router pages in src/app plus reusable React components in src/components.
- Data layer: Prisma Client (src/lib/prisma.ts) over SQLite (DATABASE_URL=file:./dev.db).
- Domain model: Prisma schema defines Jurisdiction, MetricDef, MetricValue, Source, Citation, PermitType, FeeItem, SourceDoc.
- Scoring service: src/lib/scoring.ts computes indices/grades from metric rows and returns drivers/confidence/staleness.
- Data flow: seed/import scripts populate SQLite -> pages query Prisma server-side -> scores are computed in-app -> rendered as snapshot/details/sources/methodology.
- External integrations: third-party API services for runtime data fetch Not found in repo.
- Auth/multi-user accounts: Not found in repo.

How to run (minimal)

- npm install
- npm run db:push
- npm run db:seed
- npm run dev
- Open http://localhost:3000

Notes

- Deployment environment/hosting target: Not found in repo.
